20. ABSTRACT (Continue on reverse side if necessary and identify by block number)

This report provides information and analysis on the physical condition of the dam as of the report date. Information and analysis are based on visual inspection of the dam by the performing organization.

The Phase I inspection of the New Waterville Reservoir did not indicate conditions which would constitute an immediate hazard to human life or property.

cont

DD FORM 1 JAN 73 1473 EDITION OF 1 NOV 65 IS OBSOLETE

SECURITY CLASSIFICATION OF THIS PAGE (When Data Entered)

The hydrologic/hydraulic analysis establishes the spillway capacity as 30 percent of the Probable Maximum Flood (PMF). The dam will be overtopped by 0.6 feet by the PMF and 0.3 feet under the 1/2 PMF. However, an analysis of a failure of the dam under the 1/2 PMF indicates that the downstream hazard to loss of life will not be significantly increased from that which would occur just prior to a dam failure. Therefore, the spillway is assessed as inadequate according to the Corps of Engineers' screening criteria.

An investigation should be started within 3 months to determine the source of the seepage near the toe of the embankment at the left of the gatehouse. Remedial work should be undertaken depending on the results of this investigation. This work should be completed within 18 months.

PREFACE

This report is prepared under guidance contained in the Recommended Guidelines for Safety Inspection of Dams, for Phase I Investigations. Copies of these guidelines may be obtained from the Office of Chief of Engineers, Washington, D.C. 20314. The purpose of a Phase I Investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I Investigation; however, the investigation is intended to identify any need for such studies.

In reviewing this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. In cases where the reservoir was lowered or drained prior to inspection, such action, while improving the stability and safety of the dam, removes the normal load on the structure and may obscure certain conditions which might otherwise be detectable if inspected under the normal operating environment of the structure.

It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through frequent inspections can unsafe conditions be detected and only through continued care and maintenance can these conditions be prevented or corrected.

Phase I inspections are not intended to provide detailed hydrologic and hydraulic analyses. In accordance with the established Guidelines, the Spillway Test flood is based on the estimated "Probable Maximum Flood" for the region (greatest reasonably possible storm runoff), or fractions thereof. Because of the magnitude and rarity of such a storm event, a finding that a spillway will not pass the test flood should not be interpreted as necessarily posing a highly inadequate condition. The test flood provides a measure of relative spillway capacity and serves as an aid in determining the need for more detailed hydrologic and hydraulic studies, considering the size of the dam, its general condition and the downstream damage potential.

TABLE OF CONTENTS

APPENDIX

PHASE I INSPECTION REPORT

NATIONAL DAM SAFETY PROGRAM

Name of Dam:	New Waterville Reservoir I.D. NO. NY 195
State Located:	New York
County:	Oneida
Watershed:	Mohawk River Basin
Stream:	Blair Brook
Date of Inspection:	March 13, 1981 and April 10, 1981

ASSESSMENT OF GENERAL CONDITIONS

The Phase I inspection of the New Waterville Reservoir did not indicate conditions which would constitute an immediate hazard to human life or property.

The hydrologic/hydraulic analysis establishes the spillway capacity as 30 percent of the Probable Maximum Flood (PMF). The dam will be overtopped by 0.6 feet by the PMF and 0.3 feet under the 1/2 PMF. However, an analysis of a failure of the dam under the 1/2 PMF indicates that the downstream hazard to loss of life will not be significantly increased from that which would occur just prior to a dam failure. Therefore, the spillway is assessed as inadequate according to the Corps of Engineers' screening criteria.

An investigation should be started within 3 months to determine the source of the seepage near the toe of the embankment at the left of the gatehouse. Remedial work should be undertaken depending on the results of this investigation. This work should be completed within 18 months.

The following remedial work should be undertaken during normal maintenance operations within one year:

1. Woodchuck burrows should be filled in and the rodents eliminated from the facility.

2. Trees and brush on the slope should be removed and a sod cover established to allow for easy inspection of the embankment.

3. A flood warning and emergency evacuation system should be implemented to alert the public in the event conditions occur which could result in failure of the dam.

4. A formalized inspection system should be initiated to develop data on conditions and maintenance operations at the facility.

PHASE I INSPECTION REPORT
NEW WATERVILLE RESERVOIR DAM I.D. NO. NY 195
MOHAWK RIVER BASIN
ONEIDA COUNTY, NEW YORK

SECTION 1: PROJECT INFORMATION

1.1 GENERAL

a. Authority

Authority for this report is provided by the National Dam Inspection Act, Public Law 92-367 of 1972. It has been prepared in accordance with a contract for professional services between Dale Engineering Company and the U.S. Army Corps of Engineers.

b. Purpose of Inspection

The purpose of this inspection is to evaluate the existing conditions of the New Waterville Reservoir Dam and appurtenant structures, owned by the Village of Waterville, New York, and to determine if the dam constitutes a hazard to human life or property and to transmit findings to the U.S. Army Corps of Engineers.

This Phase I inspection report does not relieve an Owner or Operator of a dam of the legal duties, obligations or liabilities associated with the ownership or operation of the dam. In addition, due to the limited scope of services for these Phase I investigations, the investigators had to rely upon the data furnished to them. Therefore, this investigation is limited to visual inspection, review of data prepared by others, and simplified hydrologic, hydraulic and structural stability evaluations where appropriate. The investigators do not assume responsibility for defects or deficiencies in the dam or in the data provided.

1.2 DESCRIPTION OF PROJECT

a. Description of Dam and Appurtenances

The New Waterville Reservoir Dam is located in the Town of Sangerfield, approximately 2-1/4 miles east of Waterville. The dam consists of an earthen embankment 520 feet long with a maximum height of approximately 45 feet. The service spillway of the dam is located near the right abutment. The upstream slope of the embankment is at a slope of 2 horizontal to 1 vertical. The area at the waterline is protected by concrete slabs. The downstream slope of the embankment is 1-3/4 horizontal to 1 vertical. The crest of the dam is 15 feet wide. The plans indicate a concrete core wall extending from 2-1/2 feet below the crest of the dam into rock or "other suitable material." The service spillway is a broad crested weir 15 feet wide which overflows into a side channel spillway which outlets through a 24 inch cast iron pipe to a pool downstream from the dam. The spillway is equipped with a trash rack to prevent clogging of the discharge pipe. An emergency spillway is located near the left

abutment of the dam. It consists of a 21 foot 8 inch wide broad crested weir which discharges through an open channel cut in original ground to a point beyond the toe of the dam. The facility provides water supply to the Village of Waterville through a 12 inch cast iron water main which runs to a valve house just below the toe of the center of the dam. This line is reduced to a 6 inch transmission main to the Village. A 12 inch diameter cast iron drain line also terminates at the valve house and discharges just below the toe of the dam. The watershed for this facility is undeveloped forest land.

b. Location

The New Waterville Reservoir Dam is located in the Town of Sangerfield, Oneida County, New York.

c. Size Classification

The maximum height of the dam is approximately 45 feet. The volume of the impoundment is approximately 95 acre feet to the top of dam. Therefore, the dam is in the intermediate size category as defined in the Recommended Guidelines for Safety Inspection of Dams.

d. Hazard Classification

The impoundment discharges through a steep sided ravine. Farm homes are located near the stream approximately 1/2 mile downstream from the dam. Therefore, the dam is in the high hazard classification as defined in the Recommended Guidelines for Safety Inspection of Dams.

e. Ownership

The dam is owned by the Village of Waterville, New York.

Contact: Clerk Treasurer
Village of Waterville
Village Hall
214 White Street
Waterville, New York 13480
Telephone: (315) 841-4221

f. Purpose of the Dam

The dam is used as a water supply source for the Public Water System of the Village of Waterville.

g. Design and Construction History

The plans included in this report bear the date of 1906. It is assumed that the dam was built shortly thereafter. No record of modifications to the structure have been discovered.

h. Normal Operational Procedures

Water from the impoundment is fed to the Village of Waterville to meet the demand of the supply system. Excess flows are allowed to discharge through the service spillway. The facility is visited approximately every 2 weeks. Slopes are mowed approximately every 2 years.

1.3 PERTINENT DATA

a. Drainage Area

The drainage area of the New Waterville Reservoir Dam is 0.38 square miles.

b. Discharge at Dam Site

No discharge records are available for this site.

Computed discharges:

Service spillway, top of dam	51 cfs
Ungated emergency spillway, top of dam	255 cfs
Reservoir drain capacity *	14 cfs

c. Elevation (feet above MSL) (estimated from USGS mapping)

Top of dam	1,510
Service spillway crest	1,506
Emergency spillway crest	1,507.33
Stream bed at centerline of dam	1,465

d. Reservoir

Length of normal pool	625 feet

e. Storage

Top of dam	95 acre feet
Normal pool (@ service spillway crest)	68 acre feet

f. Reservoir Area

Top of dam	7.4 acres
Normal pool (at service spillway crest)	5.8 acres
Emergency spillway pool	6.5 acres

g. Dam

Type - earth fill
Length - 520 feet
Height - 45 feet
Freeboard between normal reservoir and top of dam - 4 feet

* 12-inch drain with the reservoir at service spillway crest.

Top width - 15 feet
Side slopes- Upstream: 2 horizontal: 1 vertical
Downstream: 1-3/4 horizontal: 1 vertical
Zoning - None
Impervious core - concrete corewall
Grout Curtain - None

h. Spillway - Emergency

Type - Broad crested weir
Length - 21 feet- 8 inches
Crest elevation - 1507.33
Gates - None
U/S Channel - Impoundment
D/S Channel - Channel in original ground

Spillway - Service

Type - Broad crested weir
Length - 15 feet
Crest elevation - 1,506
Gates - None
U/S Channel - Impoundment
D/S Channel - 24-inch cast iron pipe

i. Regulating Outlets

12-inch drain line.

SECTION 2: ENGINEERING DATA

2.1 GEOTECHNICAL DATA

a. Geology

The New Waterville Reservoir Dam is located in the Southern New York section of the Appalachian Plateaus Province. It is part of the Appalachian Highlands, the major physiographic division.

Bedrock in the site area is the Marcellus Formation which is part of the Hamilton Group of Middle Devonian age. The formation is composed of medium-gray shaly claystone with some layers of siltstone. The claystone is fissile and deteriorates easily when exposed. Outcrops of the shale are present beyond the dam toe immediately across the stream at the approximate center of the dam and at the south end of the dam, on the ridge, opposite the dam toe. The area appears to have a glacial till cover; there were no exposures.

b. Subsurface Investigations

The 1906 plan indicates that the bottom of the concrete core wall was to go to rock or other satisfactory surface. The 1917 report indicates that the foundation bed is on gravel and earth which in this area would imply a glacial till as the foundation bed.

The 1917 State report (see Appendix E) indicates "dam fill of gravel and crushed stone".

2.2 DESIGN RECORDS

No reports were available from the original design of the dam. The construction plans are included in Appendix F.

2.3 CONSTRUCTION RECORDS

No records were available regarding the original construction of the dam.

2.4 OPERATIONAL RECORDS

There are no operational records available for this dam.

2.5 EVALUATION OF DATA

The data presented in this report was obtained from the Department of Environmental Conservation files and from the Village of Waterville, Department of Public Works. The information available appears to be reliable and adequate for a Phase I inspection report.

SECTION 3: VISUAL INSPECTION

3.1 FINDINGS

a. General

The New Waterville Reservoir dam was inspected on March 13, 1981 and on April 10, 1981. Snow conditions during the March 13 inspection prevented a complete inspection of the dam. The Dale Engineering Company Inspection Team was accompanied on the inspections by Gene Ostrander and Jack Youngs of the Village of Waterville Department of Public Works.

b. Dam

At the time of the inspection, the water level in the impoundment was at the elevation of the service spillway. The crest of the dam was uniform and no evidence of settlement was detected. The crest of the dam showed evidence of vehicular traffic due to ruts running longitudinally along the crest of the dam. A small ditch approximately 15 inches deep had been excavated across the crest of the spillway near the center of the dam to accommodate hoses which were used to siphon water from the impoundment during the cleaning operations in the summer of 1980. The right abutment of the downstream slope showed no signs of erosion or seepage. Seepage and minor sloughing was detected in the original ground to the right of the gatehouse which is situated at the toe of the dam near the center. A significant area of seepage was detected at the toe of slope of the embankment to the left of the gatehouse. Seepage was also detected in this area below the toe of slope. The area of seepage covers a distance of approximately 100 feet along the toe of the slope and into the left abutment. The seepage area covers a height of approximately 15 feet above the toe of slope. Flowing water was detected at the interface between the toe of slope and the original ground which formed the left bank of the original streambed. The water in this area showed the orange deposits of iron oxide. The surface in the area was soft and easily penetrated to a depth of 1 foot with little resistance. The slopes in the area were uniform and showed no signs of sloughing or movement. The downstream slope of the dam is uniform and no sloughing or depressions were detected. The slope is covered with a light brush cover. Some stumps of previously cut trees or brush approximately 3 inch in diameter were found. The light brush cover indicates that the slope is mowed infrequently. A few woodchuck burrows were detected in the downstream slope at an elelvation approximately 5 feet above the area where seepage was detected. The upstream slope of the impoundment is protected by concrete slabs at the waterline. This slope protection is in good condition and effectively prohibits erosion at the waterline. Some light brush was found at the top of the upstream slope.

c. Service Spillway

The service spillway situated near the right abutment is in operating condition and only a small amount of debris was lodged on the trash racks.

The discharge pipe which carries flow from this spillway is free and operating properly.

d. Emergency Spillway

The emergency spillway located near the left abutment is clear and in operating condition. The facility shows no evidence of flow having occurred through this spillway. The channel downstream from the emergency spillway discharges into the original receiving stream beyond the toe of slope of the dam. No signs of recent erosion were detected in the spillway channel.

e. Appurtenant Structures

The gatehouse at the toe of the slope was in operating condition during the summer of 1980 when the impoundment was cleaned of sediment.

f. Control Outlet

The outlet of the impoundment consists of a 12 inch pipe which terminates at the gatehouse. This line was in operating condition at the time the impoundment was drained.

g. Reservoir Area

The reservoir covers approximately 5.8 acres. Slopes into the impoundment are gradual and no evidence of slope instability was detected.

h. Downstream Channel

The downstream channel of this facility is open and allows free flow of the overflow.

3.2 EVALUATION

The visual inspection indicates that the following specific items should be addressed by the Owner:

1. A considerable area of seepage exists near the center of the dam at an elevation approximately 15 feet above the toe. Seepage was also found in the original ground beyond the toe of the dam.

2. Woodchuck burrows were found to exist on the exterior slope of the embankment.

3. The slope of the embankment is overgrown with trees and brush.

SECTION 4: OPERATION AND MAINTANENCE PROCEDURES

4.1 PROCEDURES

This reservoir is used to provide water supply to the Village of Waterville. Water is fed through the transmission lines to meet the demand of the Village water supply. Excess flow discharges through the service spillway at the right abutment.

4.2 MAINTENANCE OF THE DAM

Maintenance and operation of the dam is controlled by the Village of Waterville. The facility is visited approximately every 2 weeks but no formal operating or reporting system is in effect at the site. The downstream slope of the embankment is cleared of brush approximately every 2 years. Growth on the site indicates that the brush was not removed last year.

4.3 MAINTENANCE OF OPERATION FACILITIES

The valves controlling flow into the Village water system are in operating condition.

4.4 DESCRIPTION OF WARNING SYSTEM

No warning system is in effect at present.

4.5 EVAULATION

The dam and appurtenances are periodically inspected by representatives of the Village of Waterville.

1. Since this dam is in the high hazard classification, a warning system should be implemented to alert the public should conditions occur which could result in failure of the dam.

2. A formalized inspection system should be initiated to develop data on the conditions and maintenance operations at the facility; specifically, data should be collected and recorded regarding the amount of flow which occurs from the area of seepage.

SECTION 5: HYDROLOGIC/HYDRAULIC

5.1 DRAINAGE AREA CHARACTERISTICS

The New Waterville Reservoir Dam is located in the Town of Sangerfield, east of the Village of Waterville. The dam has a drainage area of 0.38 square miles, which is characterized by moderately steep to steeply sloping hills. The watershed is essentially undeveloped and wooded. The reservoir has a surface area of approximately 5.8 acres and outlets into Blair Brook, which is a tributary of Oriskany Creek.

5.2 ANALYSIS CRITERIA

The purpose of this investigation is to evaluate the dam and spillway with respect to their flood control potential and adequacy. This has been assessed through the evaluation of the Probable Maximum Flood (PMF) for the watershed and the subsequent routing of the flood through the reservoir and the dam's spillway system. The PMF event is that hypothetical flow induced by the most critical combination of precipitation, minimum infiltration loss and concentration of run-off of a specific location that is considered reasonably possible for a particular drainage area.

The hydrologic analysis was performed using the unit hydrograph method to develop the flood hydrograph. Due to the limited scope of this Phase I investigation, certain assumptions, based on experience and existing data were used in this analysis and in the determination of the dam's spillway capacity to pass the PMF. In the event that the dam could not pass 1/2 the Probable Maximum Flood without overtopping, additional analyses are to be performed on potential dam failures if the dam is designated as a High Hazard Classification. This process was done with the concept that if the dam was unable to satisfy this criteria, further refined hydrologic investigations would be required.

The U.S. Army Corps of Engineers' Hydrologic Engineering Center's Computer Program HEC-1 DB using the Modified Puls Method of flood routing was used to evaluate the dam, spillway capacity, and downstream hazard.

Unit hydrographs were defined by Snyder coefficients, C_t and C_p. Snyder's C_t was estimated to be 2.0 for the drainage area and C_p was estimated to be 0.625. In this analysis, the reservoir pool was assumed to be at the emergency spillway crest elevation at the start of the storm and flow through the service spillway and water transmission system was neglected.

The Probable Maximum Precipitation (PMP) was 19.8 inches according to Hydrometeorological Report (HMR #33) for a 24-hour duration storm, 200 square mile basin. Loss rates of 1.0 inch initial loss and 0.1 inch/hour constant loss were used. These assumptions yielded 84 percent run-off from the PMF. The peak for the PMF inflow hydrograph was 981 cfs and the 1/2 PMF inflow peak was 490 cfs. The small storage capacity of the reservoir above the spillway crest reduced these peak flows a negligible amount.

5.3 EMERGENCY SPILLWAY CAPACITY

The emergency spillway weir is trapezoidal in profile and rectangular in section with two intermediate piers supporting a wooden bridge that spans the opening. For heights of flow below the low chord of the bridge, weir flow will control. Heights of flow above the low chord of bridge were assumed to produce orifice flow through the bridge opening, while heights of flow above the bridge deck also produced weir flow over the deck. The discharge capacity of the emergency spillway at the top of dam elevation is 255 cfs.

SPILLWAY CAPACITY

Flood	Peak Discharge	Capacity as % of Flood Discharge
PMF	979 cfs	26%
1/2 PMF	489 cfs	52%

The discharge capacity of the principal spillway was not considered in routing flood flows. Under these high flows, debris could easily be passed over the trashrack resulting in blockage of the principal spillway outlet pipe.

5.4 RESERVOIR CAPACITY

The reservoir storage capacity was obtained from the plans included in Appendix G and USGS mapping. The resulting estimates of the reservoir storage capacity are shown below:

Top of Dam	95 Acre Feet
Emergency Spillway Crest	77 Acre Feet

5.5 FLOODS OF RECORD

There is no information on water levels at the dam site.

5.6 OVERTOPPING POTENTIAL

The HEC-1 DB analysis indicates that the dam will be overtopped by floods in excess of 30% of the PMF as follows:

Flood	Peak Inflow, cfs	Peak Outflow, cfs	Maximum Depth over Dam
PMF	981	979	0.29
1/2 PMF	392	391	0.62

A dam break analysis was performed to determine the significance of various dam failures on the downstream hazard. This analysis was performed with the 1/2 PMF assuming the earthen embankment to fail at the maximum elevation resulting from the 1/2 PMF. The various scenarios of dam failure investigated covered a range of both breach sizes and failure times to develop the full breach. The flood elevations, due to various dam failures and the flood elevations that would exist just before the corresponding dam break induced flood wave are shown below. These

flood elevations are compared at the downstream hazard area, where the creek crosses the road 2,200 feet downstream of the dam.

Bottom Width of Breach	Failure Time	FLOOD ELEVATIONS AT DOWNSTREAM HAZARD Just Prior to Dam Break	Due to Dam Break
35 ft.	0.5 hrs.	1411.4	1414.9
35 ft.	2 hrs.	1411.4	1412.9
35 ft.	5 hrs.	1411.4	1412.1
100 ft.	0.5 hrs.	1411.4	1414.9
100 ft.	2 hrs.	1411.4	1413.0
100 ft.	5 hrs.	1411.4	1412.2
150 ft.	0.5 hrs.	1411.4	1414.9
150 ft.	2 hrs.	1411.4	1413.2
150 ft.	5 hrs.	1411.4	1412.2

The above elevations were estimated from USGS quad sheets. These elevations are not exact and their significance is in the difference between the elevations for the flood levels with and without the dam failure. This analysis indicates that the flood heights would be increased from a flood height of 2.4 feet before the dam failure to a range of 3.1 to 5.9 feet due to the dam failure, depending on the particular parameters of the failure. The two residences in this area appear to be sited more than 6 feet above the streambed. Therefore, this flood depth increase would not significantly increase the hazard to loss of life due to a dam failure under this condition.

5.7 EVALUATION

The hydrologic/hydraulic analysis establishes the spillway capacity as 30% of the Probable Maximum Flood (PMF). The dam will be overtopped by 0.6 feet by the PMF and 0.3 feet under the 1/2 PMF. However, failure of the dam during the 1/2 PMF event will not significantly increase the downstream hazard from that which would occur just prior to the dam failure. Therefore, the spillway is assessed as inadequate according to the Corps of Engineers' screening criteria.

SECTION 6: STRUCTURAL STABILITY

6.1 EVALUATION OF STRUCTURAL STABILITY

a. Visual Observations

Visual inspection of this earthen embankment and concrete core wall dam indicates no evidence of misalignment, settlement or significent sloughing or erosion which would indicate serious structural movement or a condition of structural distress. However, there does exist evidence that some seepage does occur through or beneath the embankment section, as discussed below.

The downstream slope of the embankment generally is covered with light brush and grasses. Some heavy brush exists on the embankment near the toe, but virtually all of the downstream slope is visually accessible for evaluation. Though the vegetative cover is continuous over the embankment slope, it is not rated as being a dense and heavily rooted cover in regard to resistance against erosive actions. Some animal burrows were noted.

The upper segment of the dam's upstream face is protected with concrete slab sections, which were noted to be in good condition to the depths visible from inspection points on the embankment crest.

Excess reservoir flow is conducted through an overflow chamber (a concrete spillway structure) situated adjacent to the right abutment. This structure is in good condition. Normal reservoir overflow entering the chamber is carried by buried pipe to a point of discharge (into Blair Brook) beyond the downstream toe of the embankment. The emergency spillway, a broad-crested weir with concrete side walls, is located at the left end of the embankment structure. The downstream channel for this spillway follows a path which would discharge overflow below the downstream limit of the embankment structure.

A gatehouse for controlling flow to the Waterville Water Supply is located at the downstream toe of the embankment, near the midlength point.

In regard to indications of through or beneath the dam seepage, several limited areas of sloughing/erosion exist about at and just below the downstream toe of embankment. The more evident zones of such sloughing exist near the center of the embankments length; some ground dampness was observed but no seepage flow was noted. A greater extent of surface dampness exists on the lower half of the slope across approximately the left half of the embankment length. Limited seepage flow was noted at toe of slope approximately at the location where the embankment section meets the abutment topography.

b. Design and Construction Data

Generalized design drawings showing the alignment and cross-section of the embankment and information relating to the overflow chamber and emergency spillway structures are available. Information on records relating to structural design and construction are not available. The drawings

available are shown in Appendix F. The design information indicates this earthern embankment dam, on the order of 520 feet long, is provided with a concrete core wall. The maximum height of the embankment is on the order of 45 feet, with an upstream slope of 2 horizontal to 1 vertical, and a downstream slope of 1.75 horizontal to 1 vertical. Conditions visible at the time of the inspection indicate the dam, including the abutments, is in general conformance with the information indicated by the available drawings.

c. Operating Records

There are no operating records available for this facility.

d. Post Construction Changes

No records are available of significant post construction changes. Representatives of the Village of Waterville indicate the reservoir was drained and accumulated silt removed in 1980, but the dam structure was untouched.

e. Seismic Stability

No known faults exist in the vicinity of the dam. Several lineaments in the general area, which suggests possible fault lines, are noted in the Brittle Structures Map for the area (Ref. 17) One northeast trending lineament is noted about one mile north of the dam. Another lineament about one mile east of the dam trends northwest.

The rock bedding dips less than one degree to the southwest. Joints are close to vertical. The area is located within Zone 2 of the Seismic Probability Map. Only minor earthquake activity has occurred in this region. The most severe activity, indicated as intensity V-VI on the Modified Mercalli scale, occurred in 1840 in the Utica area, about 17 miles east-northeast of the dam site. Several others of lesser intensity, II or less, have occurred at various times in the past. The most recent, as well as the closest to the dam, took place in 1979 in the Chadwicks area about five miles northeast of the dam.

6.2 EVALUATION OF STRUCTURAL STABILITY

The dam embankment appears to be in good condition structurally, except for the noted seepage. The seepage condition, reportedly a condition which has been ongoing for a period of many years, apparently has not had any significant advance structural effects. However, an investigation should be conducted to determine the source of the seepage. Remedial work as determined by this investigation should be undertaken by the owner. Upon completion of the work, it is recommended that the embankment and toe area experiencing dampness and seepage be maintained on a continuous basis, with records kept of these monitoring observations, to obtain information on the condition and to detect the conditions which would indicate the need for additional remedial measures.

SECTION 7: ASSESSMENT/REMEDIAL MEASURES

7.1 DAM ASSESSMENT

a. Safety

The Phase I inspection of the New Waterville Reservoir did not indicate conditions which would constitute an immediate hazard to human life or property.

The hydrologic/hydraulic analysis establishes the spillway capacity as 30 percent of the Probable Maximum Flood (PMF). The dam will be overtopped by 0.6 feet by the PMF and 0.3 feet under the 1/2 PMF. An analysis of failure of the dam during the 1/2 PMF event indicates that the downstream hazard will not be significantly increased from that which would occur just prior to the dam failure. Therefore, the spillway is assessed as inadequate according to the Corps of Engineers' screening criteria.

The visual inspection did not reveal conditions which would indicate evidence of structural displacement or instability.

The following specific safety assessments are based on the Phase I Visual Examination and Analysis of Hydrology and Hydraulics, and Structural Stability:

1. A considerable area of seepage exists near the center of the dam at an elevation approximately 15 feet above the toe. Seepage was also found in the original ground beyond the toe of the dam.

2. Woodchuck burrows were found to exist on the exterior slope of the embankment.

3. The slope of the embankment is overgrown with trees and brush.

4. No warning system is presently in effect to alert the public should conditions occur which could result in failure of the dam.

5. No formalized inspection system is in effect at the facility.

b. Adequacy of Information

The information available is adequate for a Phase I investigation report.

c. Urgency

Items 1 through 5 of the Safety Assessment should be addressed by the Owner and appropriate actions taken within one year of this notification. The necessary investigations should be started within 3 months. The necessary remedial work as determined by the investigation should be completed within 18 months.

d. Need for Additional Investigation

An investigation should be conducted to determine the source of seepage at the toe of the embankment. Remedial work should be undertaken depending on the results of this investigation.

7.2 RECOMMENDED MEASURES

The following is a list of recommended measures to be undertaken to insure safety of this facility:

1. Woodchuck burrows should be filled in and the rodents eliminated from the facility.

2. Trees and brush on the slope should be removed and a sod cover established to allow for easy inspection of the embankment.

3. A flood warning and emergency evacuation system should be implemented to alert the public in the event conditions occur which could result in failure of the dam.

4. A formalized inspection system should be initiated to develop data on conditions and maintenance operations at the facility.

APPENDIX A

PHOTOGRAPHS

2. Upstream view of embankment looking towards left abutment. Emergency spillway at far end of embankment.

3. Crest of embankment looking towards left abutment.

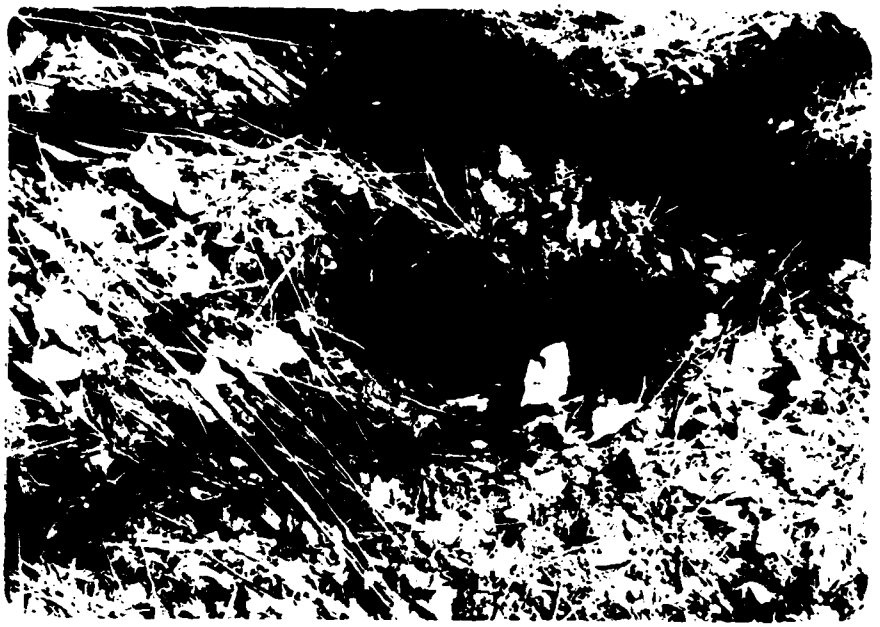
4. Downstream slope of embankment looking towards left abutment.

5. Crest of embankment looking towards right abutment. Principal spillway at far end of embankment. Gate house at left.

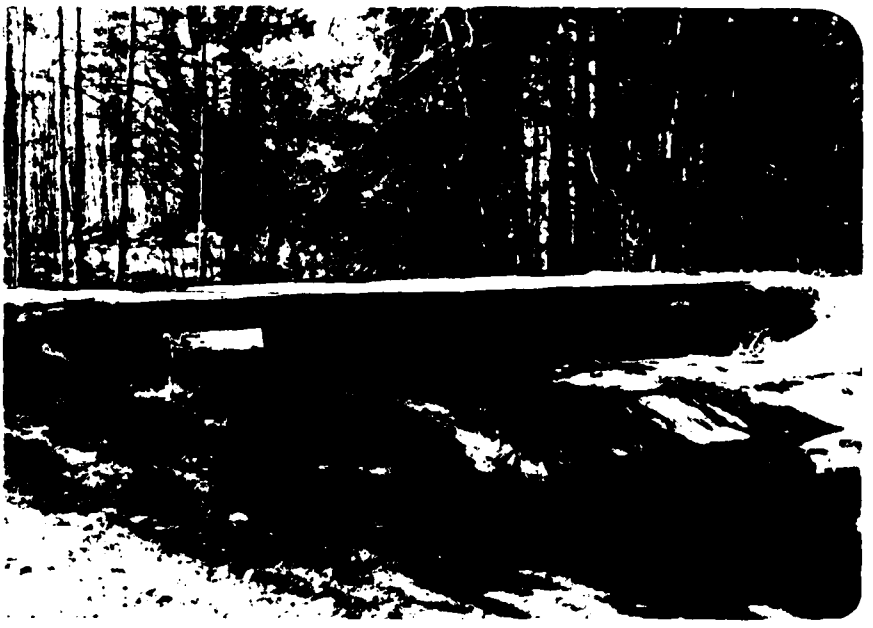
6. Downstream slope of embankment. Wet area in foreground, gate-house in left background.

7. Wet area of down-stream embankment.

8. Scarp at toe embankment near abutment. Note color.



9. Animal burrow in downstream ment.



10. Emergency spillw viewed from upstr

11. Emergency spillway channel, looking downstream.

12. Principal spillway structure as viewed from upstream.

13. Outlet pipe of the principal spillway structure.

14. Downstream hazard area, reservoir receiving stream in foreground.

2) Embankment

a. Characteristics

(1) Embankment Material EARTH FILL

(2) Cutoff Type CONCRETE CORE WALL EXTENDS TO "ROCK OR OTHER SATISFACTORY MATERIAL" PER PLANS

(3) Impervious Core CONCRETE CORE WALL TO 2'-6" BELOW CREST

(4) Internal Drainage System NONE

(5) Miscellaneous —

b. Crest

(1) Vertical Alignment UNIFORM, MINOR RUTTING FROM VEHICULAR TRAFFIC

(2) Horizontal Alignment UNIFORM

(3) Surface Cracks NONE OBSERVED

(4) Miscellaneous NONE

c. Upstream Slope

(1) Slope (Estimate) (V:H) 1:2

(2) Undesirable Growth or Debris, Animal Burrows LIGHT BRUSH AT TOP

(3) Sloughing, Subsidence or Depressions NONE - UNIFORM

(4) Slope Protection CONCRETE SLABS @ WATER LINE. GOOD CONDITION

(5) Surface Cracks or Movement at Toe NOT OBSERVABLE

d. Downstream Slope

(1) Slope (Estimate - V:H) 1 : 1 3/4

(2) Undesirable Growth or Debris, Animal Burrows FEW WOODCHUCK BURROWS

(3) Sloughing, Subsidence or Depressions NONE UNIFORM

(4) Surface Cracks or Movement at Toe NONE OBSERVED

(5) Seepage SEEPAGE IS MODERATE TO SLIGHT FOR 100 ± ft to an ELEVATION 15 FT ABOVE THE TOE

(6) External Drainage System (Ditches, Trenches; Blanket) NONE

(7) Condition Around Outlet Structure GOOD - NO EROSION.

(8) Seepage Beyond Toe SOME SEEPAGE BEYOND TOE AT CENTER OF DAM & AT LEFT (RIGHT OF VALVE HOUSE

e. Abutments - Embankment Contact

RIGHT ABUTMENT - GOOD

LEFT ABUTMENT - SEEPAGE - FLOWING WATER IN ORIGINAL STREAM BED NO PIPING OR BOILS NOTED.

(1) Erosion at Contact NO SIGNIFICANT EROSION

(2) Seepage Along Contact APPROX 100 FT OF THE CENTER TOE HAS SEEPAGE, NO SLOUGHING, NO EROSION, VERY SLIGHT DEPRESSION

3) Drainage System

a. Description of System NONE

b. Condition of System —

c. Discharge from Drainage System —

4) Instrumentation (Momumentation/Surveys, Observation Wells, Weirs, Piezometers, Etc.) NONE

5) Reservoir

a. Slopes STABLE, FORESTED - RED & SCOTCH PINE

b. Sedimentation SEDIMENT REMOVED IN 1980

c. Unusual Conditions Which Affect Dam NONE

6) Area Downstream of Dam

a. Downstream Hazard (No. of Homes, Highways, etc.) 2 HOMES ADJACENT TO STREAM - APPROX 1/2 MILE.

b. Seepage, Unusual Growth SEEPAGE FROM SLOPES OF ORIGINAL GROUND DOWNSTREAM

c. Evidence of Movement Beyond Toe of Dam NONE

d. Condition of Downstream Channel STEEP NARROW GULLY

7) Spillway(s) (Including Discharge Conveyance Channel)

6 ft WIDE SERVICE SPILLWAY DISCHARGES TO 24" CIP.
21'8" WIDE EMERGENCY SPILLWAY DISCHARGES TO CHANNEL IN ORIGINAL GROUND

a. General BOTH SPILLWAYS CLEAR AND IN OPERATING CONDITION.

b. Condition of Service Spillway GOOD CONDITION - SMALL AMOUNT OF DEBRIS ON TRASH RACK. VILLAGE INTENDS TO INSTALL 6" FLASH BOARDS IN ANTICIPATION OF DRY SUMMER

c. Condition of Auxiliary Spillway GOOD CONDITION - CLEAR NO INDICATION OF RECENT FLOW THROUGH THIS FACILITY

d. Condition of Discharge Conveyance Channel GOOD, OPEN NO EROSION WHICH WOULD EFFECT THE STRUCTURE.

8) Reservoir Drain/Outlet

Type: Pipe ✓ Conduit _____ Other _____

Material: Concrete _____ Metal ✓ Other _____

Size: 12" Length 156' ±

Invert Elevations: Entrance 1477 ± Exit 1473.5 ±

Physical Condition (Describe): Unobservable ✓

Material: CAST IRON.

Joints: UNKNOWN Alignment UNKNOWN

Structural Integrity: NO PROBLEMS DETECTED IN 1980 WHEN IMPOUNDMENT WAS DRAINED

Hydraulic Capability: _____

Means of Control: Gate _____ Valve ✓ Uncontrolled _____

Operation: Operable ✓ Inoperable _____ Other _____

Present Condition (Describe): OPERABLE DURING 1980

9) Structural

a. Concrete Surfaces N/A

b. Structural Cracking —

c. Movement - Horizontal & Vertical Alignment (Settlement) —

d. Junctions with Abutments or Embankments —

e. Drains - Foundation, Joint, Face —

f. Water Passages, Conduits, Sluices —

g. Seepage or Leakage —

h. Joints - Construction, etc. —

PREVIOUS INSPECTION REPORTS/AVAILABLE DOCUMENTS

Form IWSI. 11-6-14-1000 (16-103a) Acc. 38a

(NOTICE: After filling out one of these forms as completely as possible for each dam in your district, return it at once to the Conservation Commission, Albany.)

STATE OF NEW YORK

CONSERVATION COMMISSION

ALBANY

Reservoir
Mark 116 - 833 ~~DAM~~ REPORT
Mob.

July 16 (Date), 1917

CONSERVATION COMMISSION,

DIVISION OF INLAND WATERS.

GENTLEMEN:

I have the honor to make the following report in relation to the structure known as the New Waterville Reservoir ~~Dam~~.

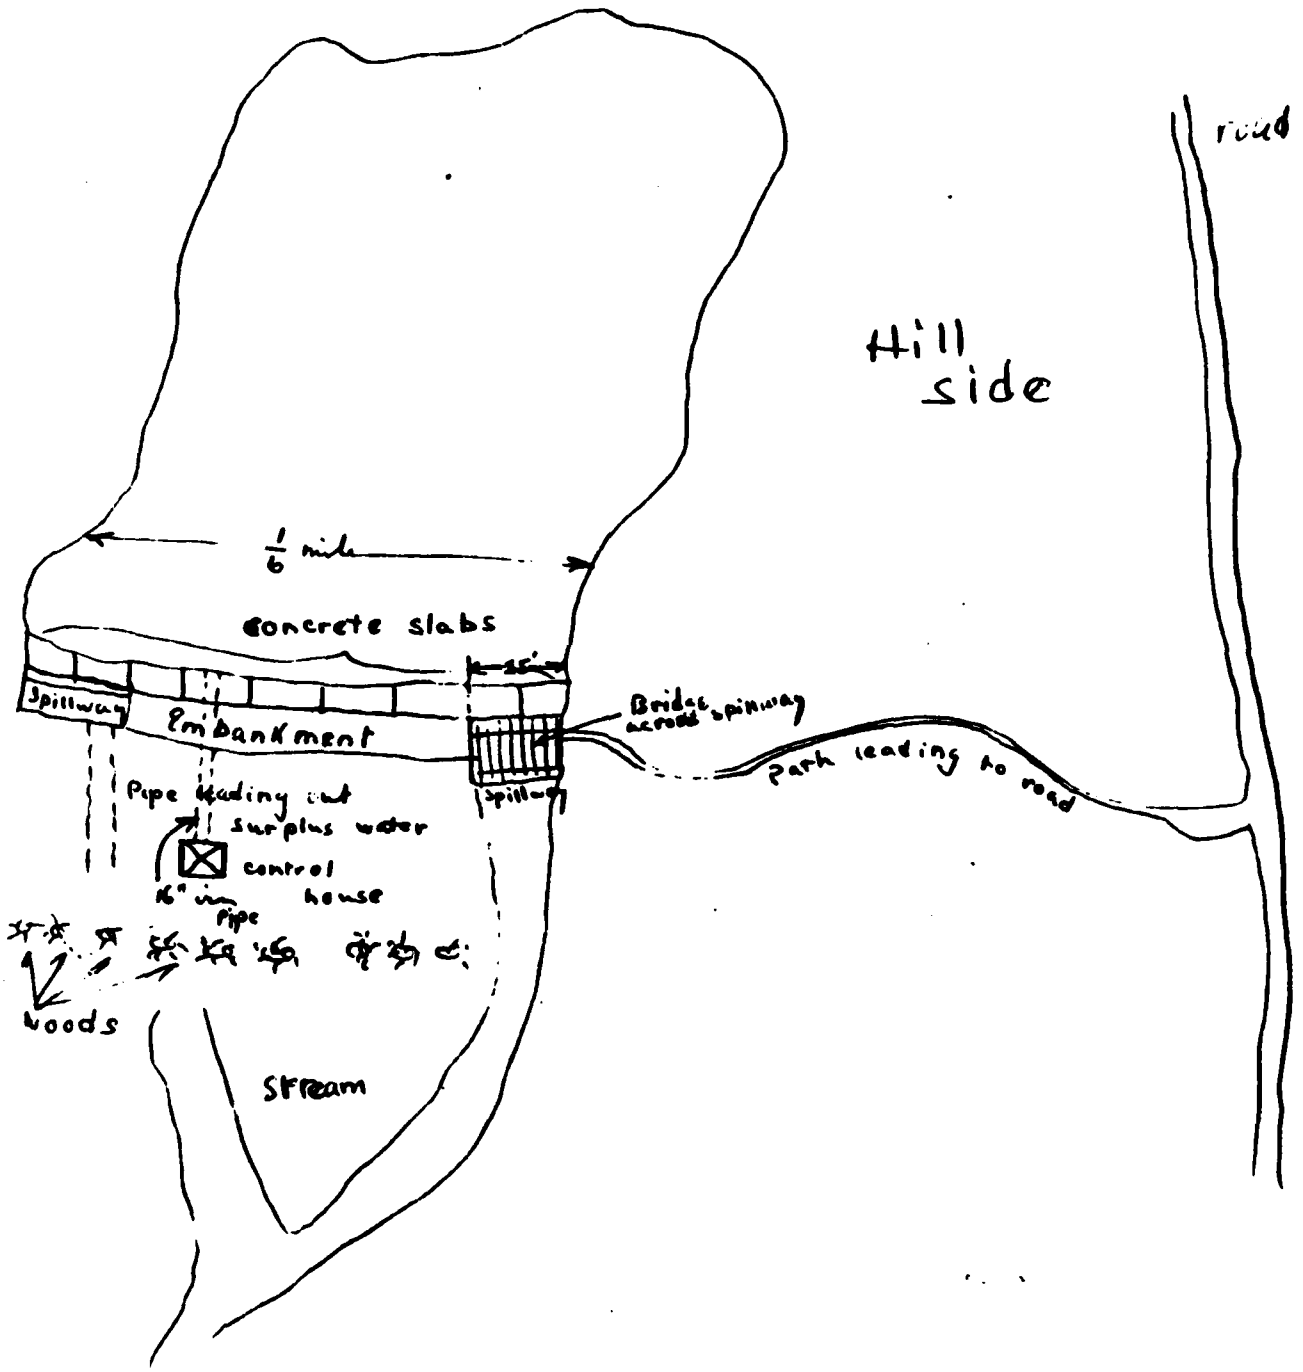
This dam is situated upon the ~~——~~ (Give name of stream) Springs Junction water in the Town of Waterville, Sangerfield County, about 4 miles (State distance) from the Village or City of Waterville. The distance down (Up or down) stream from the ~~dam~~ reservoir, to the old reservoir (Give name of nearest important stream or of a bridge) is about 1 mile (State distance).

The dam is now owned by Waterville Water Works, Waterville, N.Y. (Give name and address in full) and was built in or about the year ~~——~~, and was extensively repaired or reconstructed during the year ~~——~~.

As it now stands, the spillway portion of this dam is built of Concrete (State whether of masonry, concrete or timber) and the other portions are built of Concrete (State whether of masonry, concrete, earth or timber with or without rock fill).

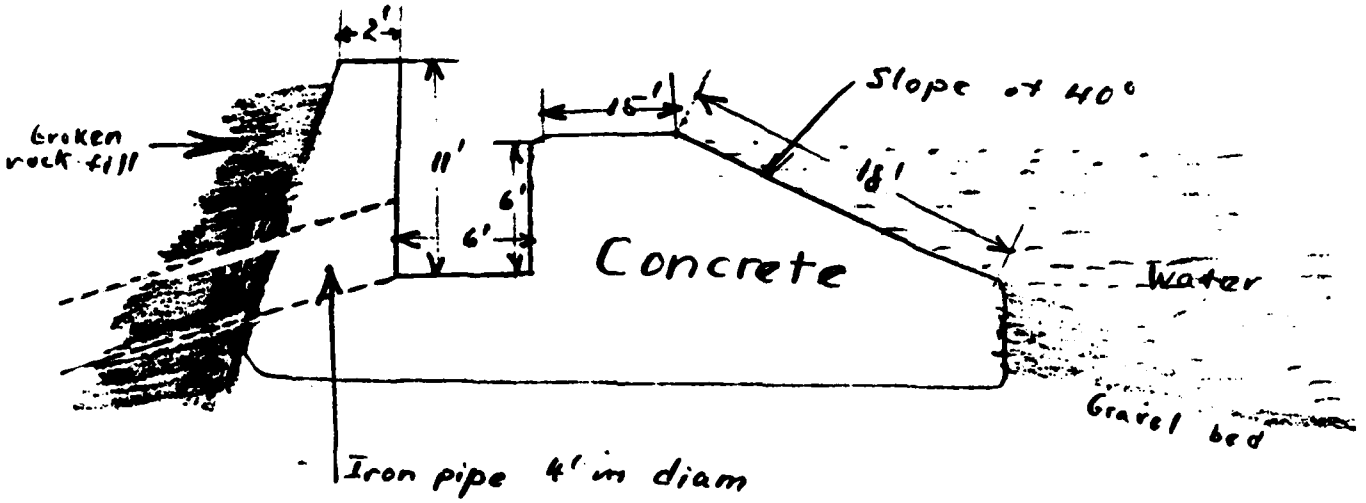
As nearly as I can learn, the character of the foundation bed under the spillway portion of the dam is gravel and under the remaining portions such foundation bed is " and earth.

[illegible] and its approximate position in relation to buildings or
[illegible]

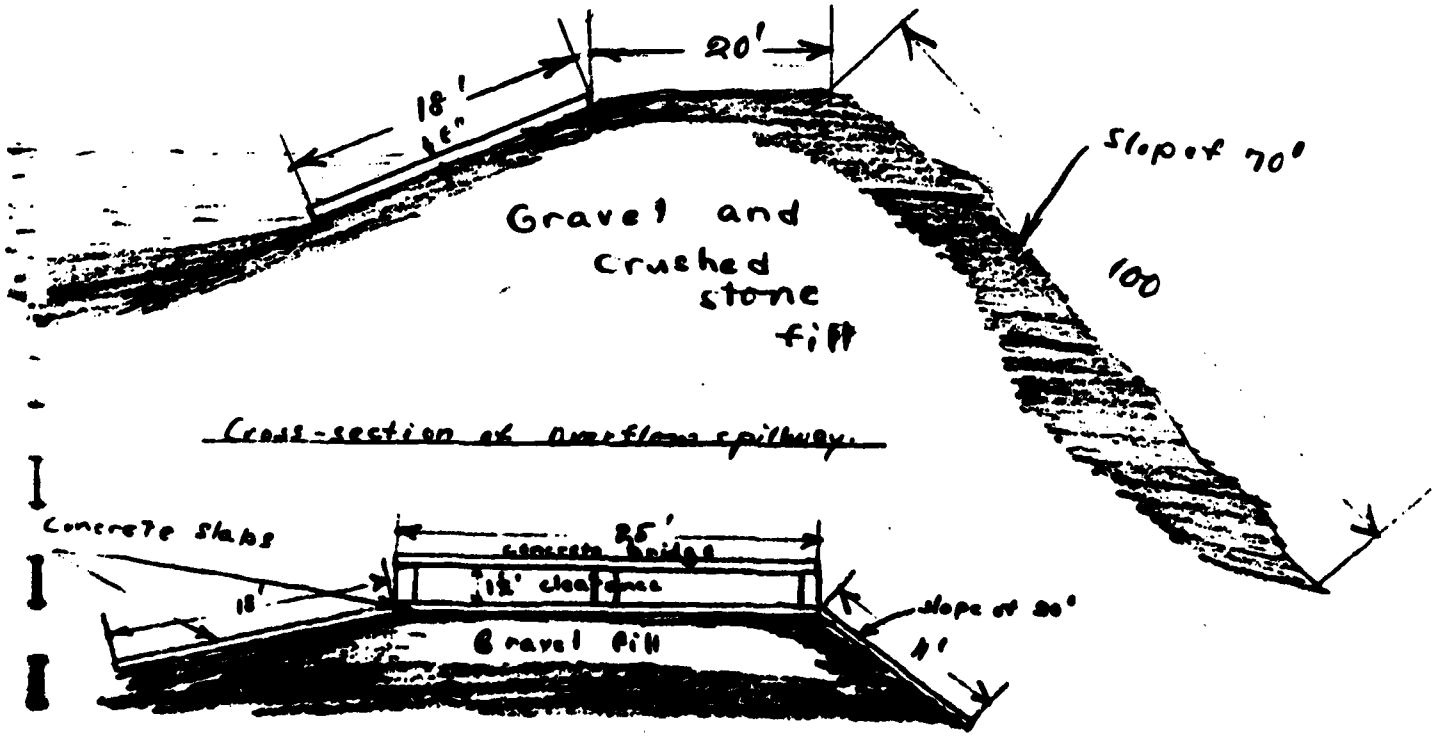


(In the space below, make one sketch showing the form and dimensions of a cross section through the spillway or waste-weir of this dam, and a second sketch showing the same information for a cross section through the other portion of the dam. Show particularly the greatest height of the dam above the stream bed, its thickness at the top, and thickness at the bottom, as nearly as you can learn.)

Cross-section of one of the spillways. (on east-side)



Cross-section of Dam-embankment.



Cross-section of overflow spillway.

50, 00, 00 yrs.

The total length of this dam is ¼ mile ~~feet~~. The spillway or waste-weir portion, is about 25' feet long, ~~and the crest of the spillway is about~~ overflow dam ~~feet below the top of the dam.~~

The number, size and location of discharge pipes, waste pipes or gates which may be used for drawing off the water from behind the dam, are as follows: There is an 16" pipe leading from the reservoir to the old one also a 4 foot pipe acting as waste pipe.

At the time of this inspection the water level above the dam was ——— ft. ——— in. ~~below~~ above the crest of the spillway. (not flowing)

(State briefly, in the space below, whether, in your judgment, this dam is in good condition, or bad condition, describing particularly any leaks or cracks which you may have observed.)

This dam is in fairly good condition. The dam part of the reservoir consists of concrete slabs laid on top of gravel. These slabs are not cemented together so that they give the water a chance to leak through the cracks.

I should suggest that these cracks be cemented or closed up in some manner.

Reported by Willard V Botsford
